

# **KAISER MEDICAL INC.**

is proud to  
introduce the new

## **TENOGLIDE**

### **Upper Extremity CPM System**

Kaiser Medical has developed a new concept in CPM. The TenoGlide is the first upper extremity CPM system with the ability to accomplish a true tenodesis motion of the wrist and hand. The advanced electronics can be programmed to isolate motion of the fingers or wrist independently, or combine any sequence of motions, in either a synchronized or random pattern. This new device is portable and the orthosis is well distributed across the forearm making it surprisingly comfortable and balanced. We have also developed a sling and a stand for this device making it even more comfortable to wear and use when walking, sitting or lying down.

---

Kaiser Medical will continue to develop new concepts and innovations in rehabilitation products and equipment. The DynaStatic™, a new concept in upper extremity splinting that combines both dynamic and static progressive capabilities is currently under development.

---
